

Energy Analysis

May 30, 2026

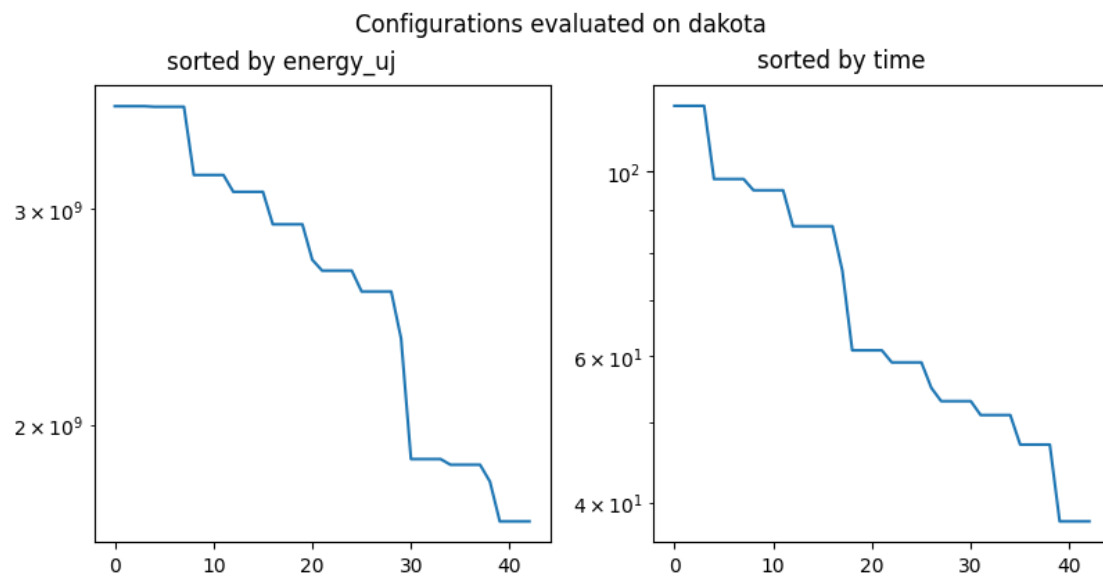

1 Plots

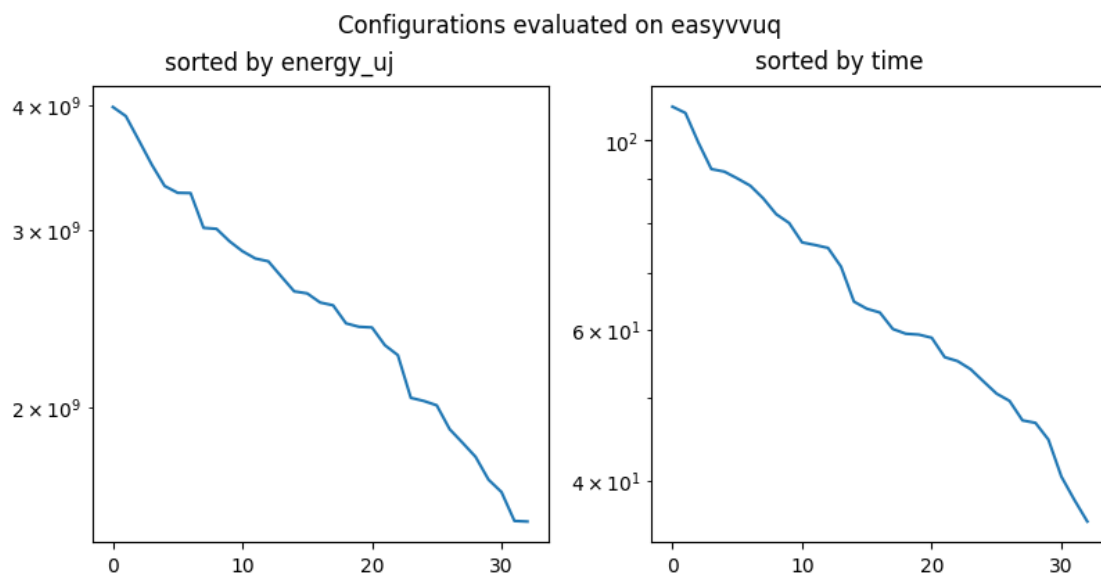

1.1 Which configurations consumed less energy or time in total

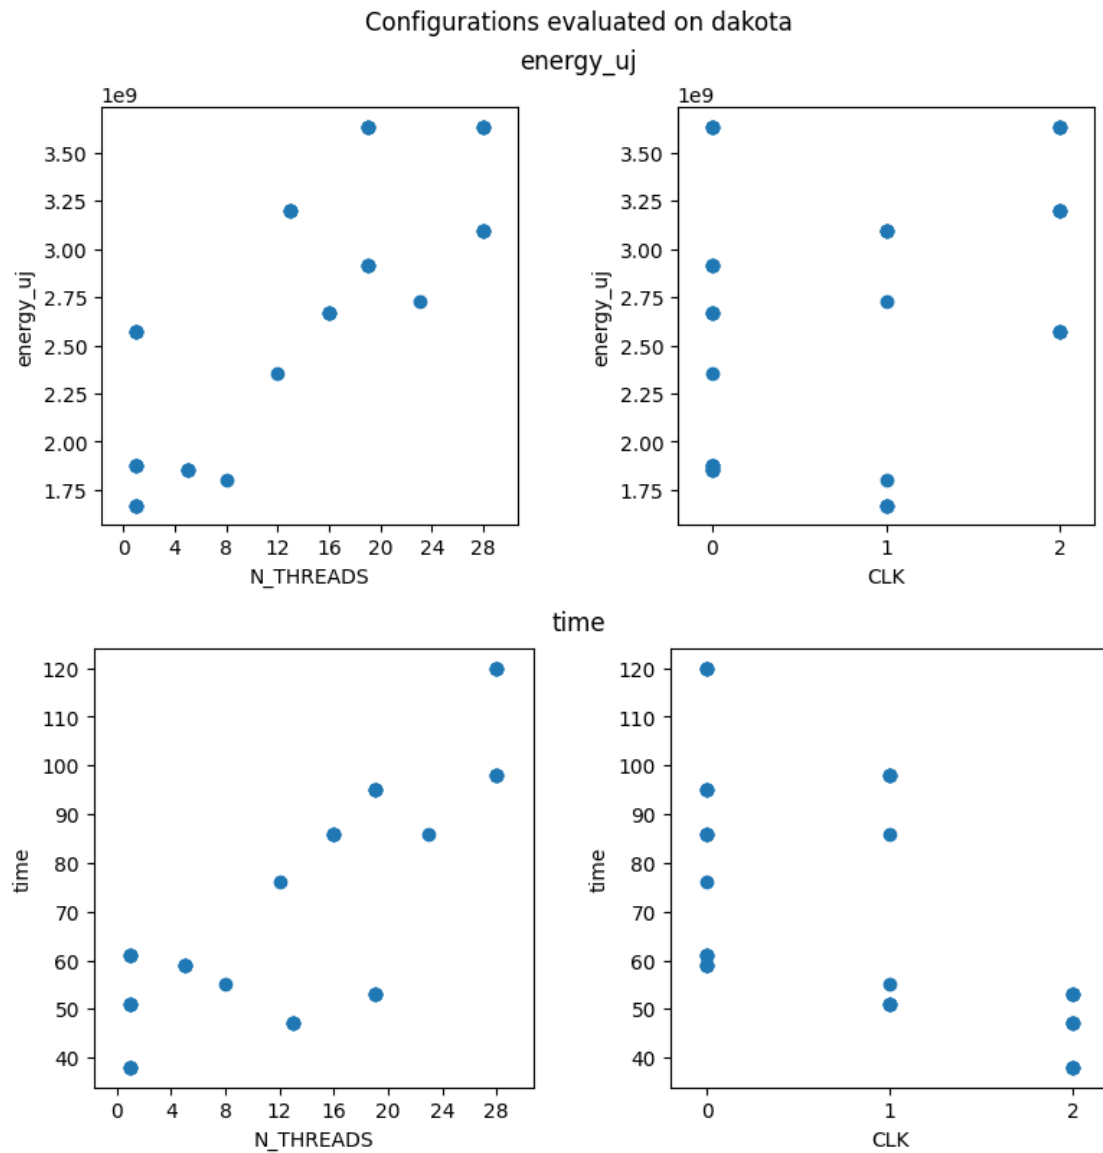

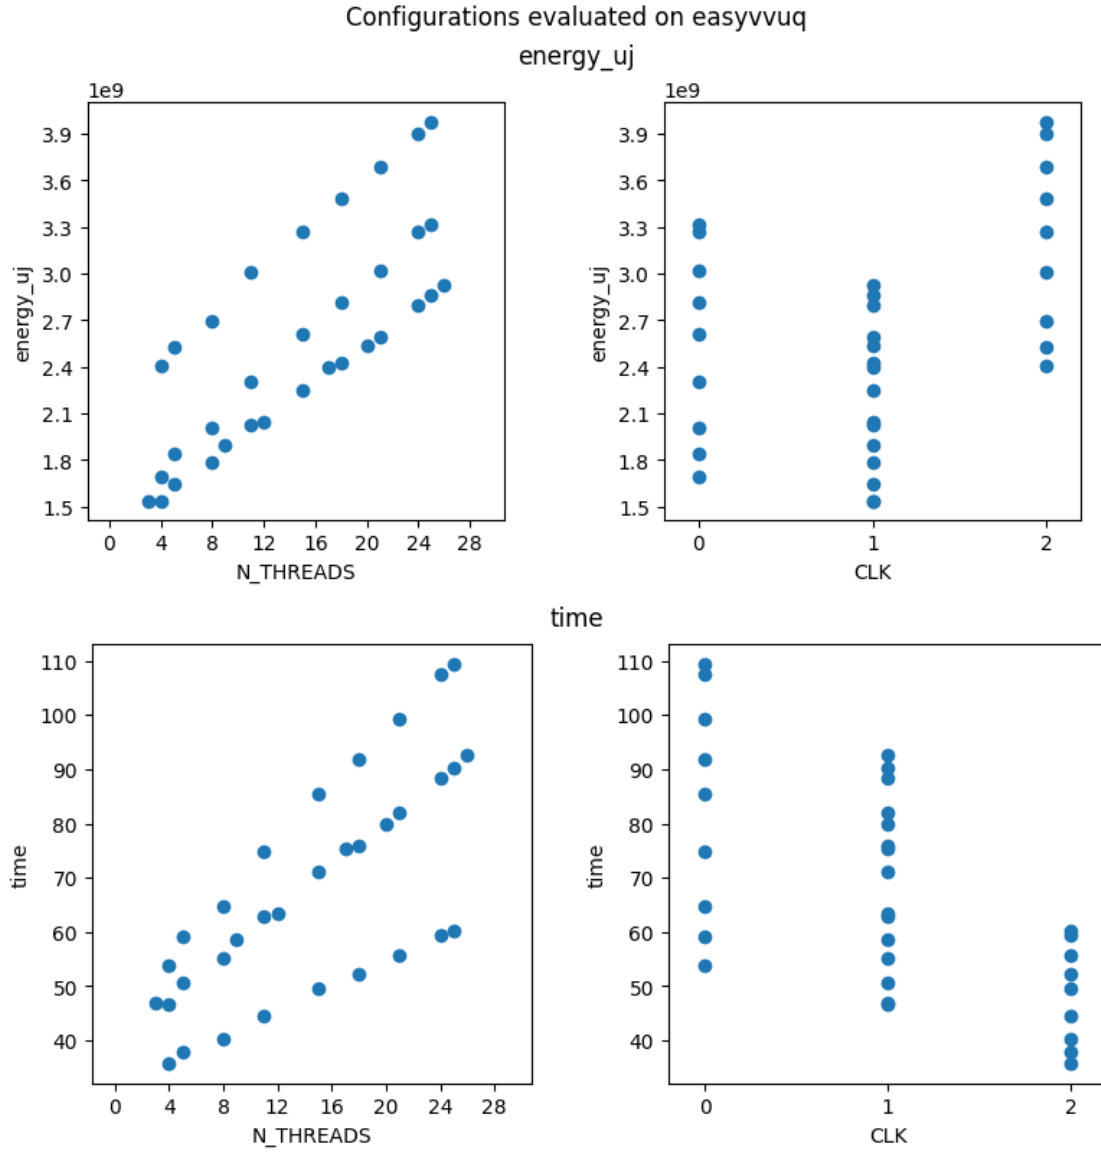

1.2 What is the difference between the best and worst configurations?

1.3 View of the resulting energy usage and time against each parameter

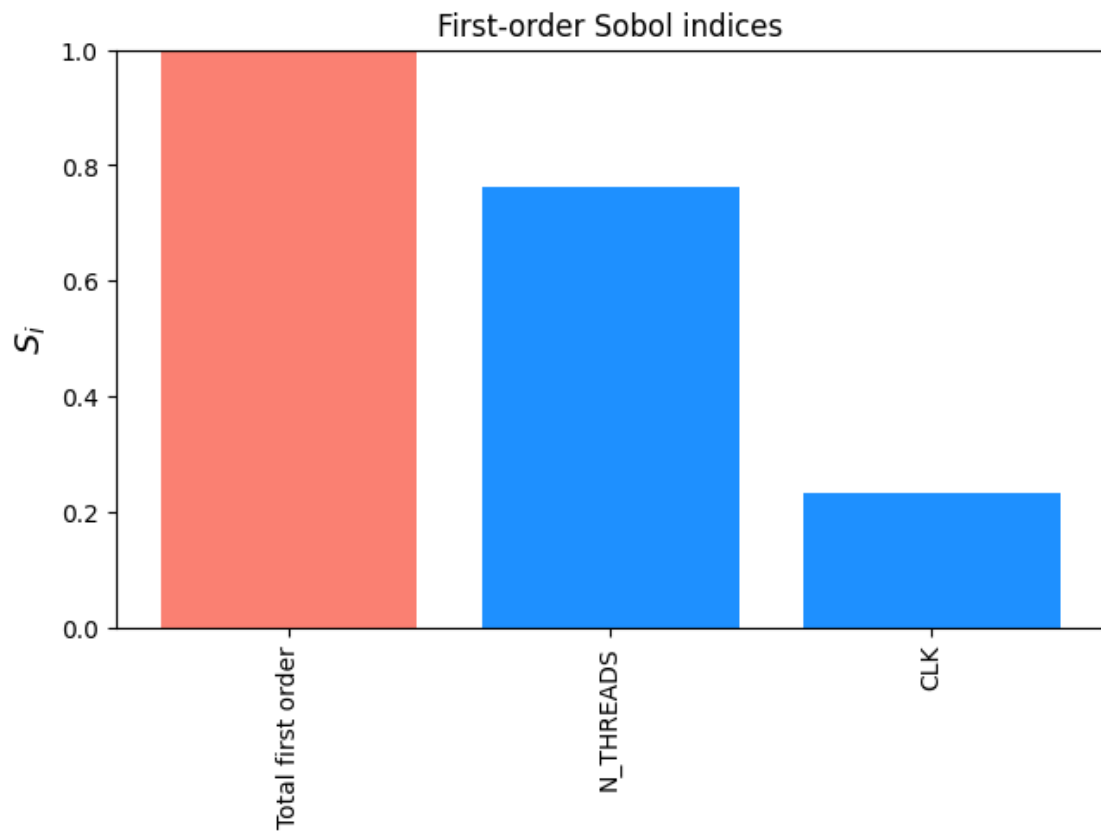

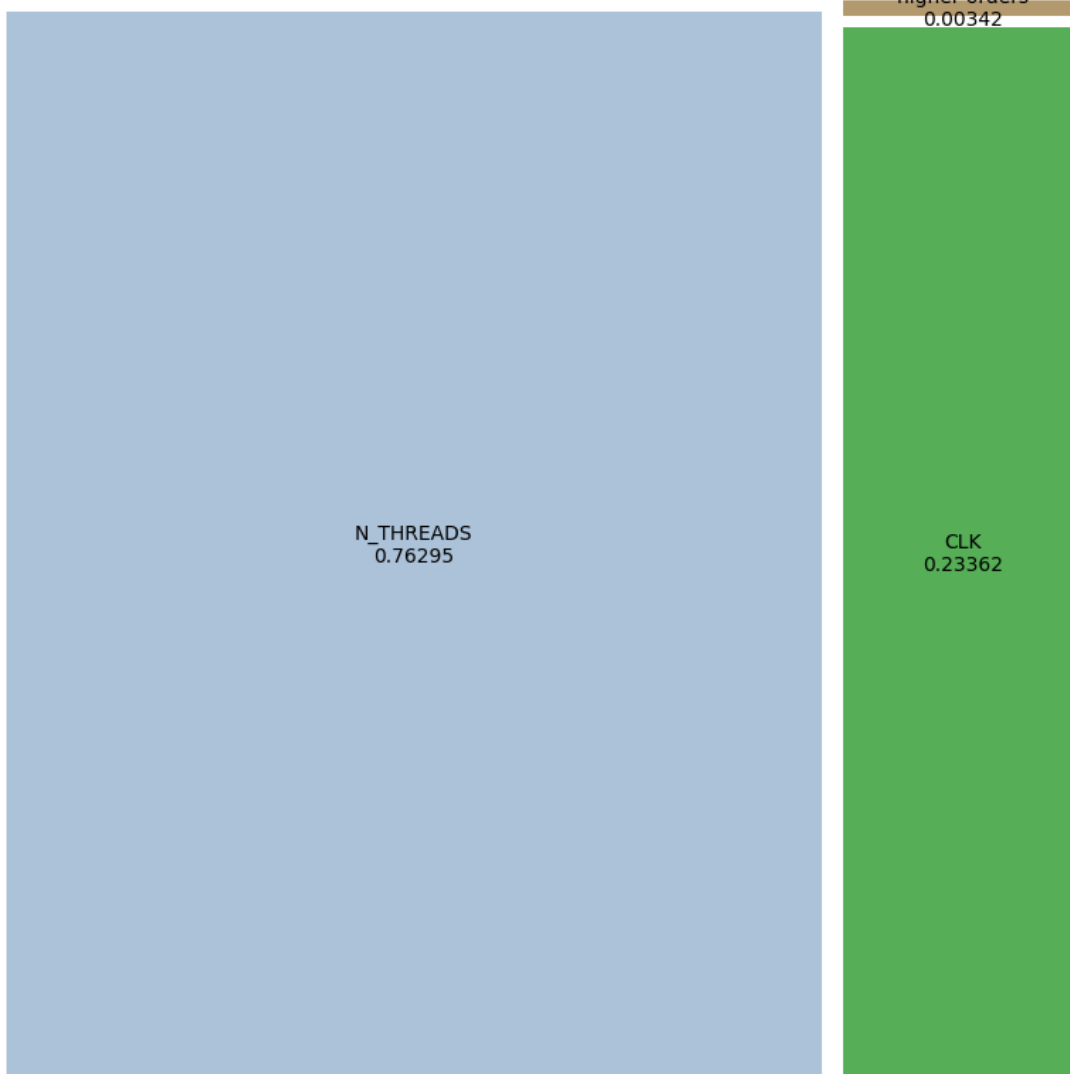

2 EasyVVUQ plots

The following could be generated only from easyvvuq, for now

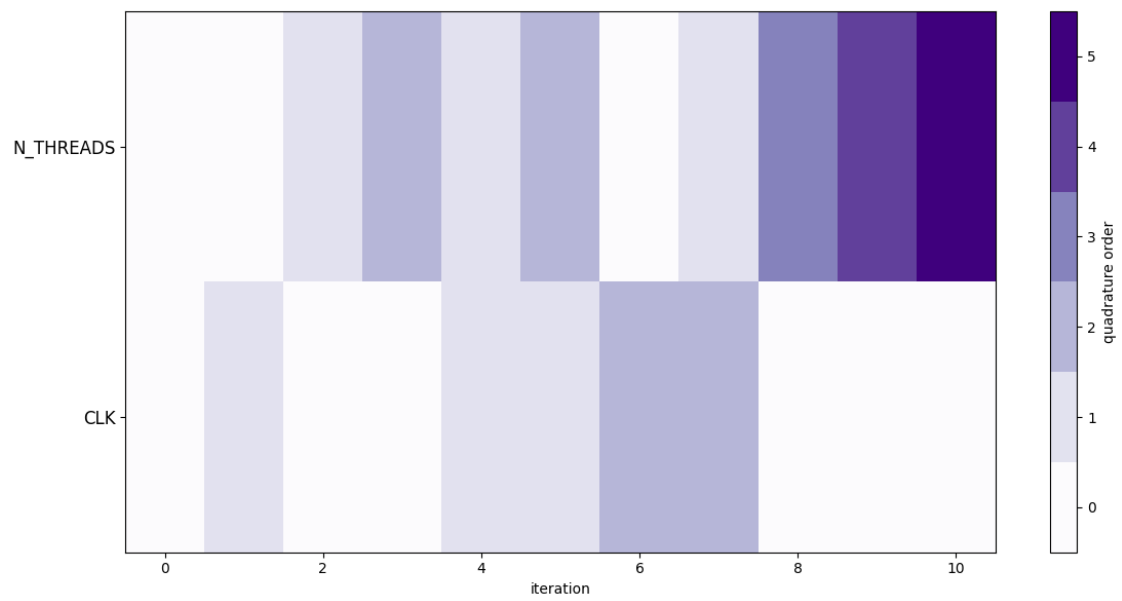

2.1 First order sobol indices and decomposition treemap

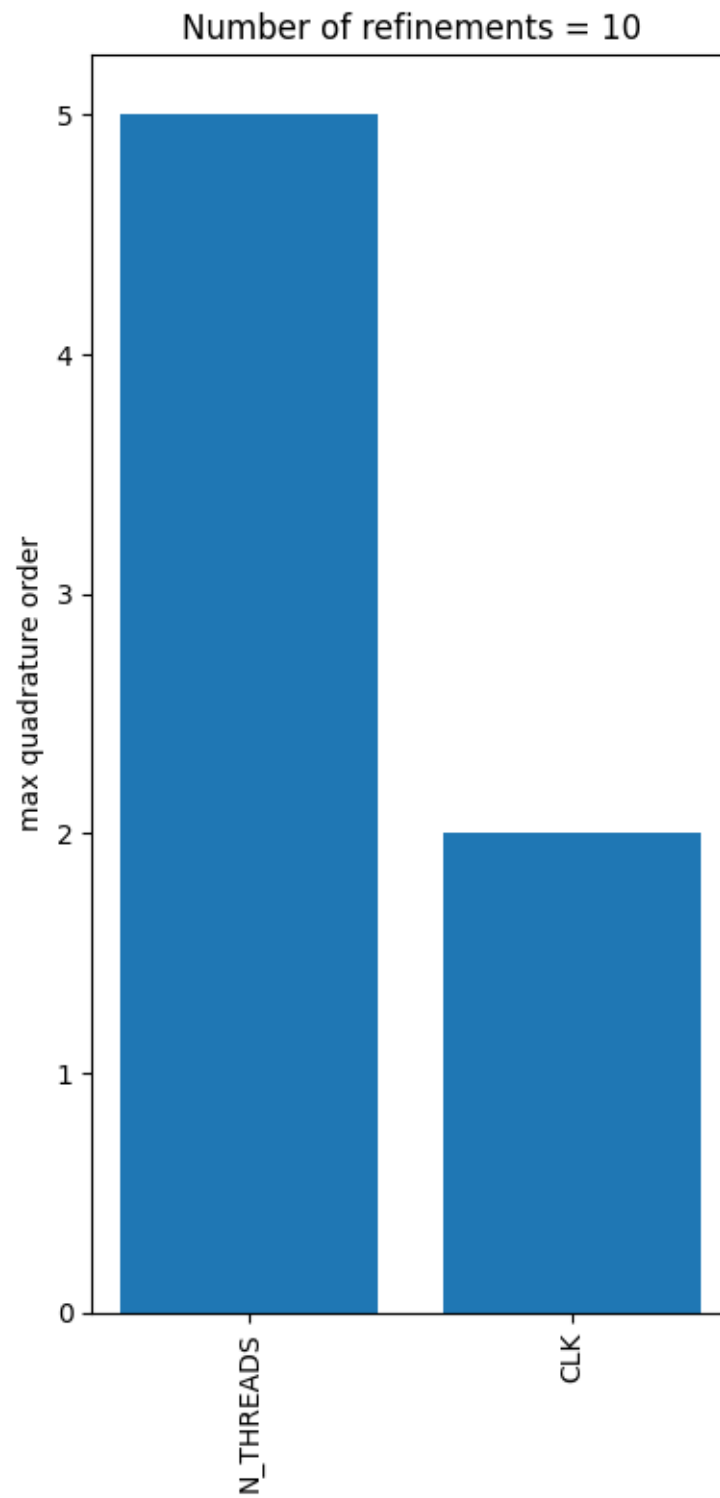

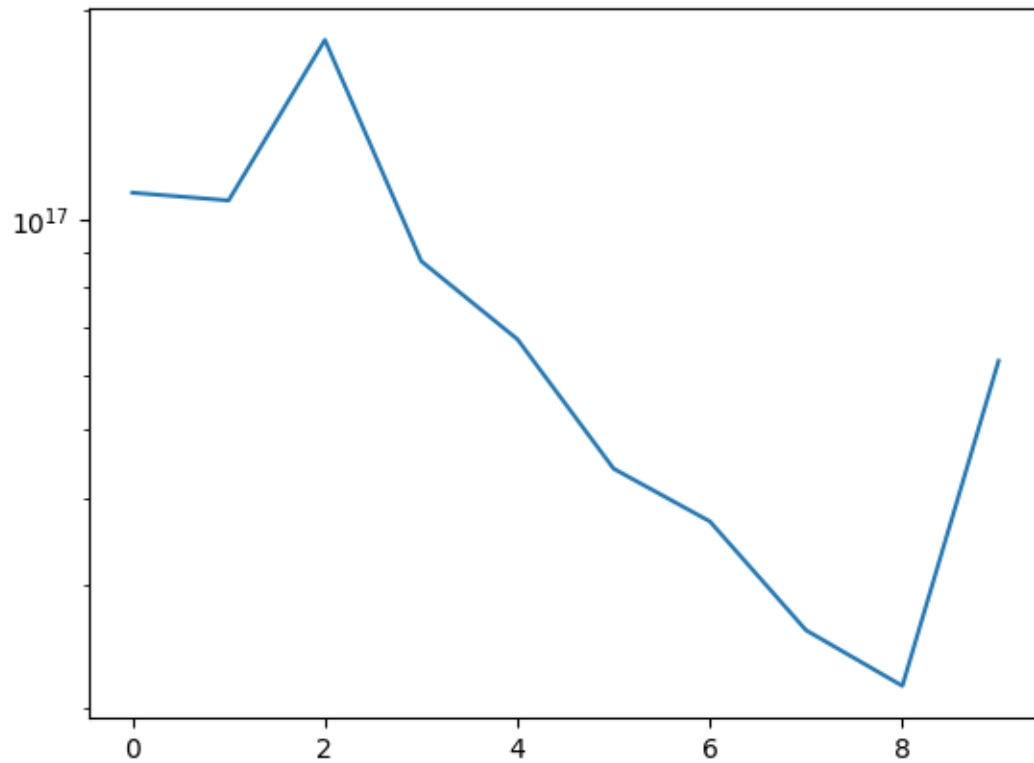

Decomposition of energy_uj variance

2.2 Adaptation table, histogram and errors

2.3 Uncertainty amplification and stat convergence

Mean CV input = 68.6791 %
Mean CV output = 26.7429 %
Uncertainty amplification factor = $0.2674/0.6868 = 0.3894$
